MERRIFIELD, WILLIAM M.

MRN: 713772

DOB: 10/30/1945

Docket # 2009024776

History of Present Illness

Segregation Rounds:

Reason for Isolation: Infectious Diseases

Findings appear alert, appear well hydrated, follow verbal orders/directions, eating as expected, physically active, does not express health concerns, not requesting sick call slip, no need to fill out sick call request slip and No housing concerns expressed by the patient.

Assessment No medical, dental or mental health concerns identified during visit

Nursing Assessment

Text Templates:

6/11/09 1:55pm pt seen lying down in bed. Confined for contact isolation-shingles. No complaints voiced. No problems noted.

Protocols (EXCLUDE MEDICATIONS)

- ☐ Benzo-withdrawal Protocol (If benzo taper was ordered) (Vital Signs daily for 5 days, Chart Alert: Unclear to transfer while on benzo tx)
- ☐ Diabetes Protocol (If patient started on insulin) (HbA1c baseline, and accucheck BID for 90 days)
- ☐ ETHO Withdrawal Protocol (If Librium or Klonopin started) (Lower tier, lower bunk, VS daily x 5 d, Chart Alert: Unclear to transfer while on tx)
- ☐ HIV Protocol (TST implant, CXR if not done within last 3 months, Referral to ID, CD4, Viral Load and CBC)
- ☐ LTBI-TB Protocol (Referral to ICN, TST implant, CXR if not done within last 6 months)
- ☒ Opioid Protocol (If patient started on meds) (Lower Tier, Lower Bunk, VS daily x 5d, Chart Alert: Unclear to transfer while on tx)
- ☐ Prenatal protocol (Referral to Shands, Prenatal profile, prenatal diet. If more than 7 months chart alert not to transfer, and lower tier/bunk)

Vital Signs: ----- Diagnosis: CHE, HTN, PolySubs Abuse, Physical Deconditioning

☐ Once a day for 3 days ☐ Once a day for 5 days (Recommended for potential withdrawal)

☒ Twice a day for 5 days (Recommended for severe withdrawals)

☐ In 3 days and weekly times two (Recommended for mild to moderate elevated BP readings on asymptomatic patients)

☐ Once a week for two weeks (Recommended for h/o of HTN no meds and normal BP readings)

☐ For 3 days and reevaluate (Recommended for initiation of tx and/or change of medication on patients with significant HTN)

☐ Other (Justify)

☐ Report if SBP > 160 or < 90 BDP > 120 or < 60 HR > 110 or < 50 RR > 25 or < 15 Temp > 100.3 SpO2 < 95%

Accuchecks (Whole Blood Finger-stick blood sugar)

- ☐ Fasting in 48 hours and in 7 days (Recommended for h/o of DM no meds and BS level WNL)
- ☐ Daily fasting for 90 days (Recommended for patients only on long acting insulin - i.e. Lantus or patients on oral hypoglycemics)
- ☐ Three times fasting a week for 90 days (Recommended for patients only on oral hypoglycemics, BS readings acceptable)
- ☒ Before breakfast and dinner for 90 days (Recommended for patients on insulin combinations)
- ☐ Two times a week fasting for 90 days (Recommended for patients on oral hypoglycemics well controlled)
- ☐ Once a week fasting for 90 (Recommended for patients on oral hypoglycemics very well controlled)
- ☐ Other (Justify)

Wound Care ----- Diagnosis/Site:		Instructions:

EXAMINATION REPORT (No Autopsy)

DECEDENT: William Michael MERRIFIELD

M. E. CASE #: 09-1093

COUNTY of DEATH: Duval

DATE of DEATH: July 05, 2009

AGE, RACE, and SEX: 63 Years White Male

DATE and TIME of EXAMINATION: July 17, 2009, beginning at 1 PM

EXAMINATION by: Jesse C. Giles, MD

TYPE of EXAMINATION: Inspection with Records Review

ROUTINE EXTERNAL EXAMINATION

The body is admitted to the examination room dressed only in a hospital gown. The body is that of a well-developed White man who appears the stated age of 63 years. Body height is 69 inches and body weight is 142 lbs. Clothing is also with the body in a bag, along with a walking cane. There are no valuables on or with the body at examination otherwise. At examination, rigor mortis is passed, livor mortis is posterior and fixed, and the body is cold to touch. Decomposition is absent externally, with no putrefaction. There is no obvious significant external injury.

Artifacts of medical and postmortem care are vascular-access puncture wounds at the left antecubital fossa, a triple-lumen IV line at the left groin, string ties around the ankles with postmortem impressions, hospital ID markers at the left foot and left wrist, and a lime-yellow ID band at the right wrist with "58325" on it.

Scalp hair is short to medium length and mostly grey. The head, face, neck, and upper shoulders show no suffusion. The eyes are brown and sunken, and the sclerae are white. There are no facial petechiae or areas of periorbital ecchymosis. Facial hair is a grey and slightly black short full beard. In the nasal and oral cavities is dried brownish-white mucus. Teeth are natural with poor oral hygiene. The neck has normal range of motion with no crepitus. The chest is mildly increased in the anteroposterior dimension. Breasts are masculine. The abdomen is sunken and soft. Extremities are symmetrical and with no deformities. The legs have no peripheral edema or skin atrophy. The fingernails are long, dirty, and brownish, and the toenails are medium length, with some thickened, curved, and yellowish-brown. The back and buttocks have no natural deformities. The anus is not remarkable. External genitalia are adult male and unremarkable aside from scrotal irritation (see below).

Significant scars, tattoos, nevi, and incidental findings are occasional seborrheic keratoses; old and new red and brown ecchymoses, skin slippages, superficial avulsed skin areas, and scars at the dorsal forearms and hands; a short horizontal scar at the left popliteal fossa; a late healing wound or ulcer at the

#31

The relevance of these observations in dogs to humans is unknown.

Do not share disposable or reusable insulin devices or needles between patients, because doing so carries a risk for transmission of blood-borne pathogens.

5.3 Hypoglycemia

Hypoglycemia is the most common adverse reaction of insulin, including LANTUS. The risk of hypoglycemia increases with intensive glycemic control. Patients must be educated to recognize and manage hypoglycemia. Severe hypoglycemia can lead to unconsciousness or convulsions and may result in temporary or permanent impairment of brain function or death. Severe hypoglycemia requiring the assistance of another person or parenteral glucose infusion or glucagon administration has been observed in clinical trials with insulin, including trials with LANTUS.

The timing of hypoglycemia usually reflects the time-action profile of the administered insulin formulations. Other factors such as changes in food intake (e.g., amount of food or timing of meals), exercise, and concomitant medications may also alter the risk of hypoglycemia [*See Drug Interactions (7)*].

The prolonged effect of subcutaneous LANTUS may delay recovery from hypoglycemia. Patients being switched from twice daily NPH insulin to once-daily LANTUS should have their initial LANTUS dose reduced by 20% from the previous total daily NPH dose to reduce the risk of hypoglycemia [*see Dosage and Administration (2.3)*].

As with all insulins, use caution in patients with hypoglycemia unawareness and in patients who may be predisposed to hypoglycemia (e.g., the pediatric population and patients who fast or have erratic food intake). The patient's ability to concentrate and react may be impaired as a result of hypoglycemia. This may present a risk in situations where these abilities are especially important, such as driving or operating other machinery.

Early warning symptoms of hypoglycemia may be different or less pronounced under certain conditions, such as longstanding diabetes, diabetic neuropathy, use of medications such as beta-blockers, or intensified glycemic control. These situations may result in severe hypoglycemia (and, possibly, loss of consciousness) prior to the patient's awareness of hypoglycemia.

5.4 Hypersensitivity and allergic reactions

Severe, life-threatening, generalized allergy, including anaphylaxis, can occur with insulin products, including LANTUS.

5.5 Renal impairment

Due to its long duration of action, Lantus is not recommended during

periods of rapidly declining renal function because of the risk for prolonged hypoglycemia.

Although studies have not been performed in patients with diabetes and renal impairment, a reduction in the LANTUS dose may be required in patients with renal impairment because of reduced insulin metabolism, similar to observations found with other insulins. *[See Clinical Pharmacology (12.3)].*

5.6 Hepatic impairment

Due to its long duration of action, Lantus is not recommended during periods of rapidly declining hepatic function because of the risk for prolonged hypoglycemia.

Although studies have not been performed in patients with diabetes and hepatic impairment, a reduction in the LANTUS dose may be required in patients with hepatic impairment because of reduced capacity for gluconeogenesis and reduced insulin metabolism, similar to observations found with other insulins. *[See Clinical Pharmacology (12.3)].*

5.7 Drug interactions

Some medications may alter insulin requirements and subsequently increase the risk for hypoglycemia or hyperglycemia *[See Drug Interactions (7)].*

BACK TO TOP

6. ADVERSE REACTIONS

The following adverse reactions are discussed elsewhere:

- Hypoglycemia *[See Warnings and Precautions (5.3)]*
- Hypersensitivity and allergic reactions *[See Warnings and Precautions (5.4)]*

6.1 Clinical trial experience

Because clinical trials are conducted under widely varying designs, the adverse reaction rates reported in one clinical trial may not be easily compared to those rates reported in another clinical trial, and may not reflect the rates actually observed in clinical practice.

The frequencies of treatment-emergent adverse events during LANTUS clinical trials in patients with type 1 diabetes mellitus and type 2 diabetes mellitus are listed in the tables below.

Table 1: Treatment-emergent adverse events in pooled clinical trials up to 28 weeks duration in adults with type 1 diabetes (adverse events with frequency $\geq 5\%$)

	LANTUS, %	NPH, %
